

This tip can help you speed up the network on Windows

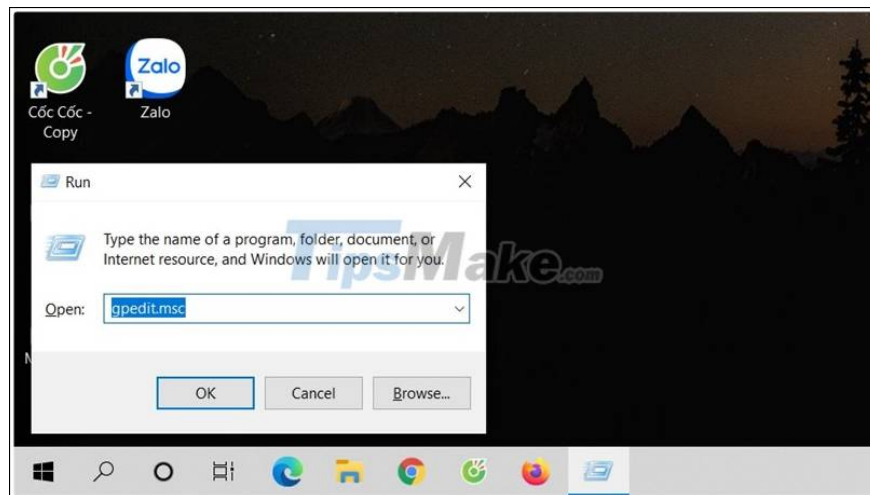

Have you ever used Windows operating system on your computer, have you ever felt that Internet-related tasks are only effective up to 80%?

With today's article I will guide a simple tip that can help you speed up your Windows network up to 100% and you will see the difference.

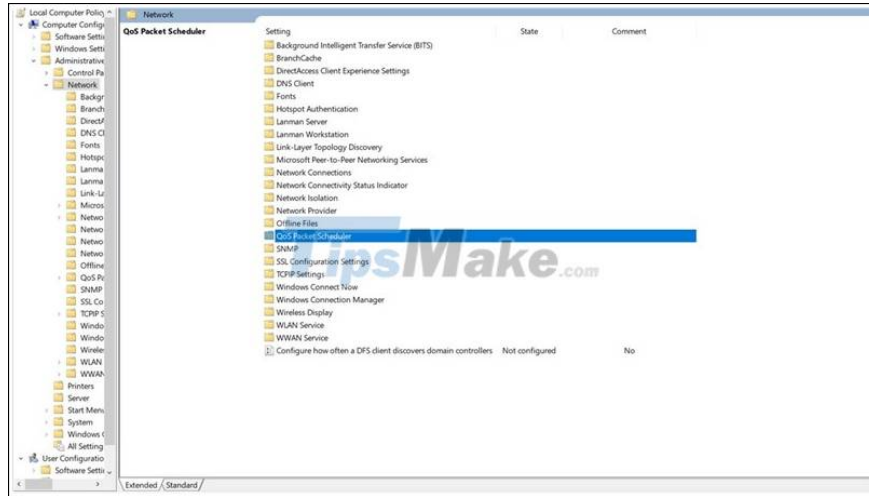

Instructions on how to increase network speed on Windows

First you need to open the Run tool by pressing **Windows + R** key combination .

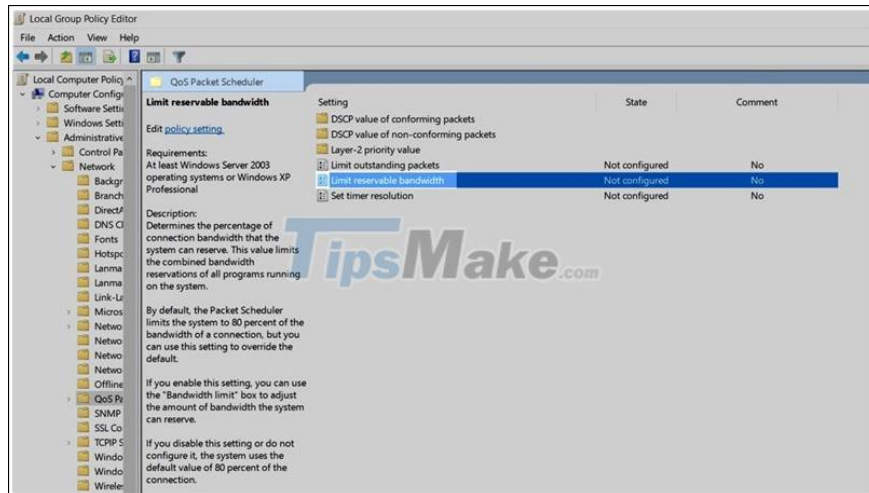

Step 1: Then, enter the words **gpedit.msc** in the opened window.

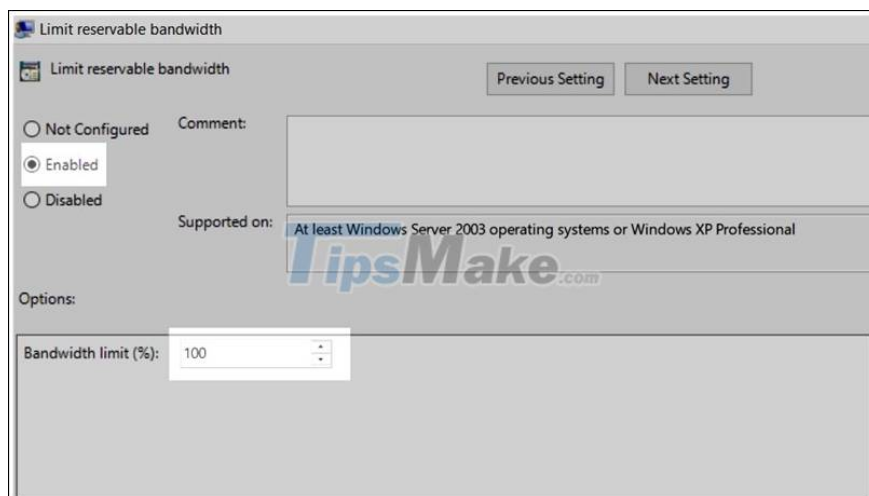

Step 2: Then, go to **administrative templates > Network > QoS packet scheduler**.

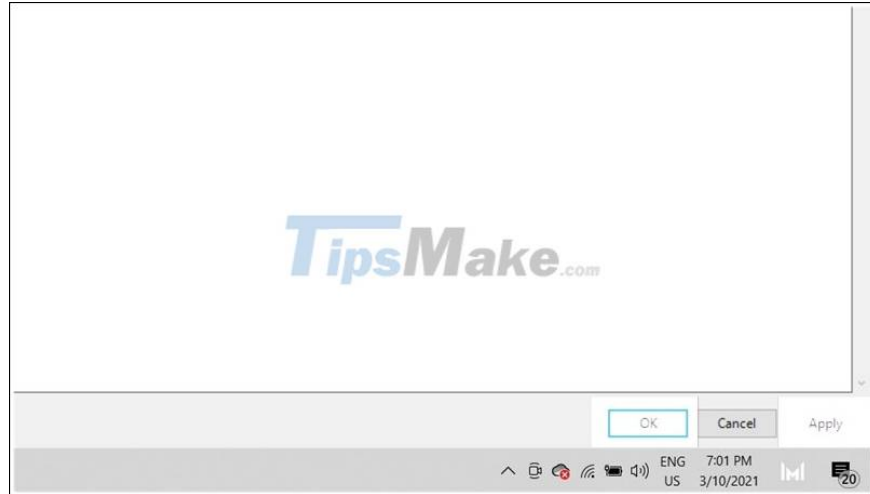

Step 3: After opening the dialog box according to the path above, you choose according to the instructions below to open the window to change parameters (**limit reservable bandwidth**).

Step 4: Select **Enabled** and choose according to the picture with number **100** .

Step 5: Once done, choose **Apply** and **Ok** . Experiment to see how strong the network signal is.

This article has given you a simple way to increase the network speed on your Windows computer significantly. Thank you very much for viewing the article.
