

Three reasons to buy an Android phone instead of an iPhone SE

Apple has just launched a new iPhone SE model with the appearance of iPhone 8 and the configuration of iPhone 11, giving potential customers a better price option than other high-end iPhone models.

For a lot of people, this is quite good news, not only because they don't want to spend too much money on a new iPhone, but because big iPhone models like the iPhone 11 Pro simply aren't right for them.

A new 4.7-inch iPhone is probably the exact phone the user is looking for, though there are many people who are calling Apple to launch an even smaller, closer iPhone. with an iPhone SE 4-inch screen as possible.

But a new and old phone doesn't make sense, so spending \$ 400 on an iPhone instead of buying a new Android phone might not be the right choice. Here are three main reasons that can convince you to consider choosing Android before pressing the new iPhone SE order button.

Outdated design

First and foremost, the iPhone SE is an older model. iPhone SE 2020 looks exactly like the iPhone 8 that has been launched since 2017, continuing to use the Home button with Touch ID on the front.

On the other hand, at \$ 400, there are many Android smartphones with more beautiful designs, and some even have a fingerprint sensor embedded in the screen to reduce the size of the device, with rabbit ears (but there's no

Face ID, just normal cameras), and other design improvements.

Although for many people, the familiar design of the iPhone SE will make more sense, but in fact, this design can not compare with the new generation iPhone models and other Android devices available on the market today. now on.

The iPhone SE was released in 2020, but it doesn't look much different from the iPhone 6 launched in 2014. In other words, the iPhone SE is using a 6-year-old design.

At the same price, the Android world will bring more valuable options

If you're shopping for the iPhone SE 2020 because "it's an iPhone," then take a look at the Android world a little bit, and you'll find plenty of other options that offer a much higher value for money. .

Samsung Galaxy A51

An example is the Samsung Galaxy A51, currently priced at \$ 349, which not only supports 5G, but is also equipped with a 6.5-inch Super AMOLED screen, 4GB of RAM, a microSD card slot, and a quad-lens camera cluster on the back.

It also has many other interesting features, including an in-display optical fingerprint sensor, Bluetooth 5.0, and even a headphone jack - you get everything for less than a 2020 iPhone SE.

New generation features

And even though the iPhone SE itself is equipped with new generation hardware, including Apple's new chip, there are still many other Android devices with similar prices but with a lot of features that you often only see on the models. more advanced machines.

The proof of living here is the Galaxy A51 mentioned above: it is equipped with up to 4 rear cameras (iPhone SE only 1 only) and fingerprint sensor under the screen.

And of course, you also have great features like fast charging and a 4,000mAh battery, more than enough for you to comfortably use the large 6.5-inch screen.

After all, buying a new smartphone isn't merely about "it's an iPhone" or "it's a Samsung". Researching what options you have should be the first thing to do when you want to spend hundreds of dollars on a new phone, and if you suddenly realize that the choices you make are so appealing, Do not hesitate because today's smartphone market is!
