

Top 5 tips for fast and safe phone battery charging

Technology companies have now released a multitude of technologies that help shorten battery life. However, there are times when they cannot function properly. So in this article I will guide you on how to fix the error of not being able to charge quickly.

With the increasingly modern technology, today's modern smartphones are fully capable of handling real laptops. Besides, there is still an eternal thing that you easily encounter is that battery technology is still developing 2 or 3 years slower than other components.

As a result, technology companies have come up with a multitude of technologies that help shorten battery life. However, there are times when they cannot function properly. So in this article I will guide you on how to fix the error of not being able to charge quickly.

1. Use Cable, Adapter to charge well

First, you need to check if your charging devices are damaged during use, the cable is broken or peeling. A few minor injuries can lead to the device shutting off its own fast charging because overheating causes explosion, and you should also pay attention to the fast charging technologies built into each other phone device. together. Because there are many Chinese carriers that have proprietary fast charging technologies that won't be compatible with the general standards you buy from outside.

2. Using Wireless Charging technology

Not entirely true, because special wireless charging with proprietary technology from a few brands can still charge up to 50W fast. However, with the vast majority of smartphones today, that figure is only 10W, which is the common charge for all phones today. Should remove the case and limit all obstacles to the device to charge

faster and cooler.

3. Use the Charging Port in good condition

The main cause comes from the charging port, which is due to the dirt sticking for too long, making the contact area of the charger smaller and your phone will charge significantly slower. If the charging port is damaged, your phone is out of battery. So please regularly clean the charging port of the device for a more stable and excellent use.

4. Turn off Apps running in the background

Having too many apps running in the background will increase the traffic to your device's resources, and it will also make your device use more power and charge slower than normal. There is a simple way to disable the applications used in the background of the device, but this will reduce your experience with the device I already own. wirelessly while charging and after charging is complete you will get a message as normal again will help your phone charge significantly faster.

5. Fix battery status

Battery health is one of the reasons for the device not being able to charge quickly. Excessive bottling of a battery can lead to explosion if at high temperature so your device will prevent too much current from being charged to the battery, avoid overheating causing explosion. whether to charge longer than usual and use it up more than usual. If so, it is definitely the status of the battery bottle and need a quick battery replacement to be able to fully experience the device and be safer for yourself.

So I gave you 5 ways to effectively overcome slow charging on smartphones. If you find the article useful, please give me a like and a share. Thank you very much for viewing the article.
