

Top 5 tips to help you take better photos with your iPhone

Actually, when we buy an iPhone, there are no manuals, so we have to tinker with it ourselves. The camera, for example, has so many hidden options, features and photography tips that users must be surprised when it is used properly.

With these tips, photos taken with your iPhone will have better color filters, clear layouts, better focus .

1. Use grid mode

During the process of taking pictures, the iPhone camera is very easy to tilt the image, affecting the photos taken on the horizon. Therefore, turn on the grid mode on the camera so that you can compose your photos more clearly (eg 1/3 or 2/3 composition).

This mode divides the screen into 9 shapes in a 3 × 3 rectangle. To show gridlines, simply go to Settings> Camera> Grid to enable this feature.

2. Turn on the HDR feature

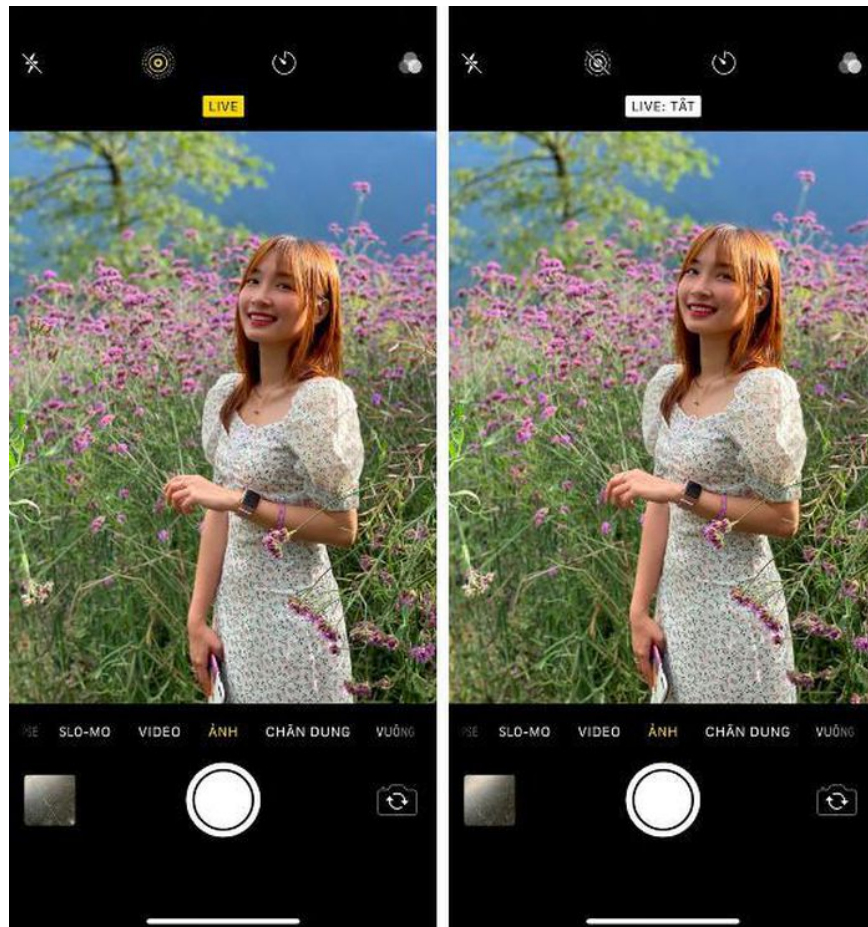

HDR (High Dynamic Range - large dynamic range). The working principle of the HDR mode is that after the user presses the shutter button, the smartphone will automatically take many photos with each different brightness, then combine them into one to balance the light.

This feature will brighten the image in backlit conditions, while it does not cause the image to "burn out". With low-light shooting conditions, HDR is a savior, while giving both bright results but also high detail.

3. Take Live Photos

For many, this feature is not very appealing. A live photo is like a short film in which the captured object will move. So if you want to capture the moment then shoot the Live mode and choose the desired image.

4. Adjust the exposure of the photo

You just need to tap the screen to adjust the exposure of the photo. If a part of the photo is very dark, you can press the dark area to improve exposure.

At this point, you see a sun icon on a slider, drag the slider up to increase the brightness or pull down to dim the area of your choice. However, there may be some parts of the image that will be blown out, so you need to adjust it just enough to need to be between light and dark.

4. Shoot with available photo color filters

While taking a photo, swipe up from the bottom to be able to see through the available color filters of the iPhone. Sure, color filters will not disappoint you. Use it for street, landscape, portrait . will be very helpful.
