2. WinRAR

WinRAR is a powerful archive manager with the ability to decompress RAR, ZIP and many other compressed files downloaded from the Internet. These files are compressed using a compression tool, such as WinRAR, before they can be shared over the Internet. The compression feature makes it easy to compress large files into just a few kilobytes or megabytes before attaching them to emails.

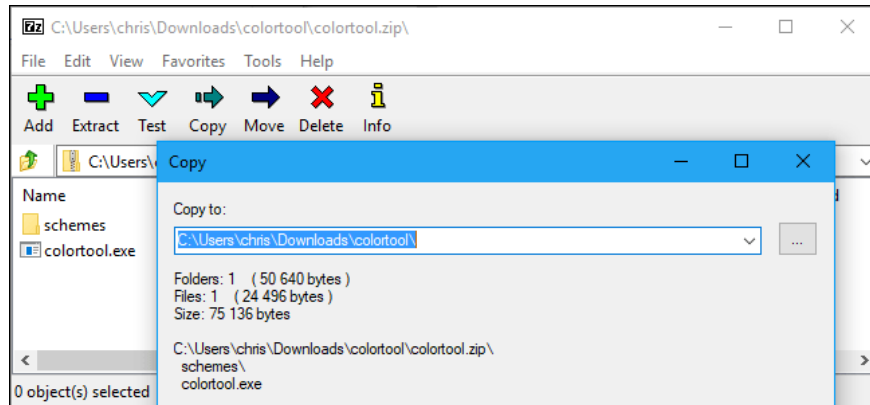

Its main use is to create, view and decompress archive file formats, mainly RAR and ZIP files. Developed by Eugene Roshal in April 1995 and distributed by Alexander Roshal from WinRAR GmbH, it has become one of the most popular data compression tools for Windows. You will find many different decompression tools, but WinRAR has to be the most compact and effective because it handles most compression formats.

Your device may also have a native app to decompress downloaded files, so you may not need a third-party decompression app to get the job done. But the native application may have certain limitations, such as not being able to decompress some compressed file formats. Make sure you can extract any files by installing WinRAR on your device.

5. PeaZip

PeaZip uses open source technology to help get the job done quickly. The software can compress and decompress about 150 different file formats. In addition, PeaZip also has a Portable version so it does not require users to install the software like other software.

One of PeaZip's most outstanding features is the random password generation feature. You just need to specify how many characters long the password is, then click the button to generate your password. If you do not want to use the password, click that button again to delete the password.

In addition, PeaZip also integrates the '16 in all' compression feature and includes the ability to split large files into different files of smaller sizes.

You can specify the size of your file in sections, or choose one of several pre-specified sizes.

For example, in case you want to email a folder that is 30MB in size, you can split this folder into 2 different files, one file containing 24.5MB and another file containing 1.5MB, then proceed. Send each file one by one.

However, the recipient will have to use PeaZip software to 'mount' these files into a single file.
