

Toshiba displays 3D Laptop without glasses

The Japanese electronics company showcased the Qosmio series notebook model using a special type of display that allows 3D images to be displayed without the need to wear accessories.

The Japanese electronics company showcased the Qosmio series notebook model using a special type of display that allows 3D images to be displayed without the need to wear accessories.

3D devices without glasses such as TVs, game consoles, tablets . promise to explode in the future. However, the weakness of this technology is that users have to choose the right angle to be able to fully experience 3-dimensional images.

Toshiba's laptop has partly overcome that thanks to a webcam at the top of the screen that is able to accurately identify the location of the human eye to create the best 3D images at every angle. The product uses 120 Hz image scanning (minimum to see 3D images).
