

'Treat' Yahoo Messenger virus

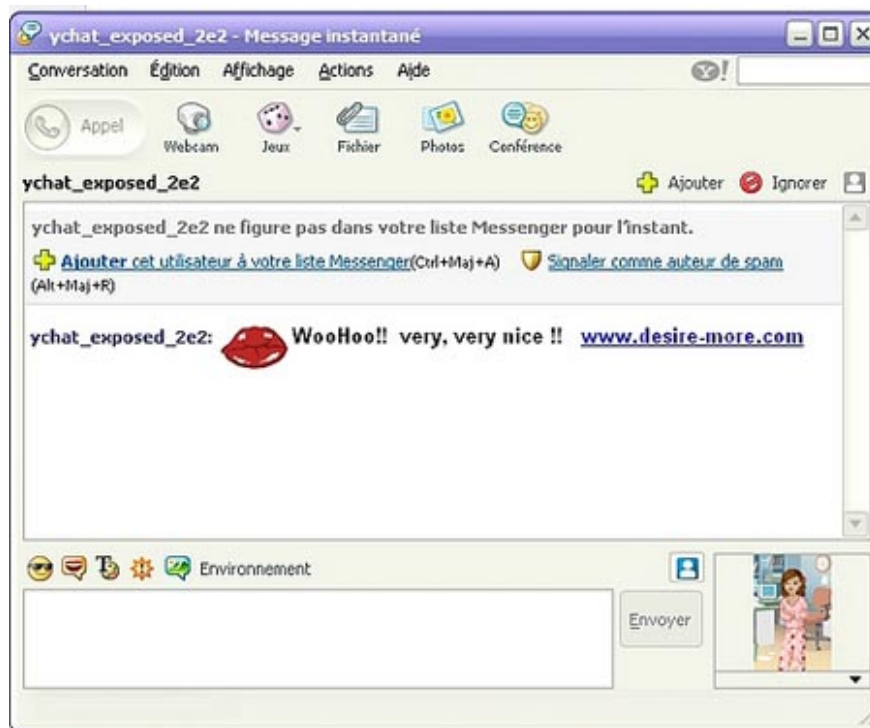

In the meantime, many viruses via Yahoo Messenger messages have caused many people to be upset and frustrated. This article explores viruses through Y's messages! and a few tips to remove them.

In the meantime, many viruses via Yahoo Messenger messages have caused many people to be "frustrated" and frustrated. This article explores viruses through Y's messages! and a few tips to remove them.

This code can save for a while if it has been infected with a Yahoo Messenger virus spread by spam messages.

Virus Y! Messenger is very dangerous for program vulnerabilities through Java script and VBS. You can easily get infected when clicking on a download link (.JPG). When the site appears to load images, java scripting will run VBS (visual basic script - works on any Windows computer) overwriting data on the hard disk.

After being infected, the virus starts sending messages to all members of the invitation list clicking on their link (as the example below). The message is changed, it automatically spreads randomly according to different keywords from the virus database.

Some more dangerous malware also destroys popular programs like antivirrs and firewall software so these programs will become useless.

** Please note that this is a code that applies to most messenger viruses, not all. It is best to use anti-spam and anti-virus software. The code below can be done by storing it as a file with the .bat extension (batch file). To do that, open Notepad, paste the code correctly and then select Save As from the File menu in the editor. Save it with the name yvirusremoval.bat (for example) on your hard disk.

It is best to restart the computer in safe mode, then run the batch file. Once done, reinstall Yahoo Messenger.
