

Turn your computer into a FPT server

With the installation and use is quite simple, it seems that this is a great solution for people to access your computer over the Internet. It is also very convenient in case you have to work mobile in many different places, but accessing the data in the machine at the head office is necessary.

With the installation and use is quite simple, it seems that this is a great solution for people to access your computer over the Internet. It is also very convenient in case you have to work mobile in many different places, but accessing the data in the machine at the head office is necessary.

RemoteHome 2000 (RH2K) is software that makes data on your computer accessible from any computer connected to the Internet. Others can access your data using a web browser (by typing ftp: // your_ip address) or using an FTP Client (LeapFTP, CuteFTP .).

RH2K is compatible with all Windows, only 865 KB in size, you can download it for free at: <http://snapfiles.com/download/dlremotehome.html>

After downloading, unzip and run the file 'rh2kb.exe' to proceed with the installation.

At the first run, the program will ask you to choose the connection type by running 'RH2K_IP.exe'. You select 'Yes'. Later, whenever you connect to the Internet, RemoteHome will automatically determine your IP address.

Now run the RemoteHome program, you will see a small icon at the bottom right of the screen, right-click, select Open to enter the program's control window:

- Username, Password: username and password used to access your PC.
- Port: the default port is 21.
- Max. user: the maximum number of people that can access your device (default is 0, that is, unlimited).
- Root dirs: the directories you use to store data for sharing. Your friends can see what you want to share in these folders.

Other options:

- Connected via LAN: if you connect via local network, check this box.
- Allow anonymous access: allows anonymous access (should not be selected).
- Allow deletion of files: allows deleting files on your computer.
- Allow deletion of non empty directories: allow to delete directory.

- Allow creation of directories: allows creation of directories.
- Allow renaming: allows renaming files / folders.
- Allow uploading file: allows uploading data from their device to your phone.
- Allow downloading file: allows downloading data to their device. In order for others to access your device, you must "Enable now".

Now that everything is done and others can start accessing your device already, just let them know the IP, Username and Password you set up at the beginning, then they can use any FTP. Which client to access.
