

Ultra-thin keyboard, foldable and pocket-sized like a cover, costs just over VND 20,000

Researchers from Sejong University in Korea have used silicon rubber in combination with nano-sized conductive carbon particles to create an ultra-thin, durable, portable keyboard that can be used for or fold it up and put it in the bag like a cover without being damaged.

Researchers from Sejong University in Korea have used silicon rubber in combination with nano-sized conductive carbon particles to create an ultra-thin, durable, portable keyboard that can be used for or fold it up and put it in the bag like a cover without being damaged.

The researchers drew on the planes of digits and other letters to help users know the typing position. At the same time, it integrates the use of artificial intelligence network to help the device identify letters or characters based on the position and pressure pushed on the keyboard.

Nano rubber keyboard can be easily rounded without worrying about malfunction.

Nowadays, there are many types of compact keyboard devices that are close to ultra-thin, but they often use rigid push buttons and tactile sensors on multi-layer soft sheets that can only be folded. Curving in a certain small angle should occupy a lot of space. In addition, due to the high cost of materials, it is difficult to produce these devices.

Mobile keyboards and regular laptops are quite large and bulky.

Keemin Sohn researchers, Ji Sik Kim, Kee-Sun Sohn - the project leader stated that the new ultra-thin nano rubber keyboard works perfectly, even better than conventional portable keyboards. both in function. Not only is it better, more convenient for moving but this device is also very cheap, only about 1 USD (more than 20,000 VND) each so users can easily replace it if it is broken.
