

Users have more reasons to use Google Snapseed thanks to this update!

After acquiring software company Nik Software last September, on November 6, Google released the popular photo editing application Snapseed for smartphones and tablets running the Android platform.

After years of minimal updates, Google has surprised us with a significant refresh of its popular photo editing app SnapSeed . Version 3.0, now available for iPhone and iPad, introduces a sleeker interface, smoother controls, and new features designed to improve your photo editing experience.

Stylish interface and new features

If you don't already have Snapseed, head over to Apple's App Store and download the latest version. The new interface was spotted by 9to5Google, as there's been no official press release about the update.

As Google says:

You may notice some new things emerging here.

The first change you'll notice is the new grid view on the home screen. This makes it easier to view and manage previously edited photos. At the bottom center, there's a floating "plus" action button (FAB), clearly designed for quick editing.

The editing tools themselves are also neatly organized into 3 simple tabs:

1. **Looks** : Instant, one-tap filters.
2. **Faves** : Personal space to save tools you use frequently.
3. **Tools** : Snapseed's entire library of powerful editing options.

Additionally, Google has moved the **Export** button to the upper right corner, freeing up space and simplifying navigation.

One standout feature is the new arc-based control system. Instead of traditional sliders, adjustments now follow a curve. This is intuitive and surprisingly precise when adjusting brightness, contrast, and other settings.

The update also includes subtle visual improvements like a new, simpler app icon with a modern green leaf logo.

Snapseed is not forgotten yet

You might be wondering if Snapseed is getting left behind. The last major update was years ago, and the minor bug fixes weren't promising. This upgrade suggests that Google wants to make Snapseed one of the go-to photo editing apps for your iPhone or iPad.

Snapseed has always had a cult following for its powerful tools packed into a free package with no ads or subscriptions. The redesign doesn't take that away. Whether you're doing a quick edit on a photo or diving deeper into advanced edits, the new version will please everyone.

Mobile editing apps like Lightroom , VSCO , and Instagram are constantly evolving. Snapseed's update gives it the momentum to compete strongly again, especially with cool features like new film-style filters that are reminiscent of classic Kodak and Fuji film. In many ways, Snapseed is better than Lightroom Mobile when it comes to photo editing.

For now, this update is exclusive to iOS devices. However, the substantial nature of these improvements suggests that Google isn't abandoning Android phones. The update's release notes hint at more improvements to come, so if you're on Android, you can expect similar improvements in the future.
