

Virtual assistant Facebook helps you avoid 'difficult' situations

Facebook is working to develop artificial intelligence to create a smart virtual assistant, helping users avoid embarrassing or unfavorable issues on this social network.

Facebook is working to develop artificial intelligence to create a smart virtual assistant, helping users avoid embarrassing or unfavorable issues on this social network.

This assistant will learn how to detect anomalies in postings of users and warn users to make informed decisions. For example, it can distinguish user photos in normal state from photos in drunken state to remind users if they intentionally upload.

Yann LeCun, head of the Facebook Artificial Intelligence Research Laboratory, said that when he finds you are about to post something unusual, the assistant will remind you of something like: " *This will be posted. Are you sure you want your boss and your mother to see this?* ". Even this technology can remind you if a photo has your face posted on Facebook by someone you don't know.
