

What ancient monsters can kill Megalodon super shark?

Many people still know giant Megalodon sharks as a sea ruler. With a size of up to 20m, the same bite can bite up to 11-18 tons, enough to crush a car so that they can hunt any prey in the ocean today like a sea lion. , dolphins, big whales ... With that fearful power, what else must Megalodon be afraid of?

Many people still know giant Megalodon sharks as a sea ruler. With a size of up to 20m, the same bite can bite up to 11-18 tons, enough to crush a car so that they can hunt any prey in the ocean today like a sea lion. , dolphins, big whales . With that fearful power, what else must Megalodon be afraid of?

But in fact Megalodon still has to be wary of another "monster". It's **Livyatan Melvillei** - an ancient monster capable of killing super sharks.

Melvillei carnivorous whale fossils were discovered late in 2008, after Megalodon for nearly 400 years.

Melvillei dominated the ocean from around the Jurassic to the New Age. Its shape is similar to modern sperm whale, with a length of 13.5-18 meters and weighing about 50 tons and possessing massive " weapons" to hunt giant prey.

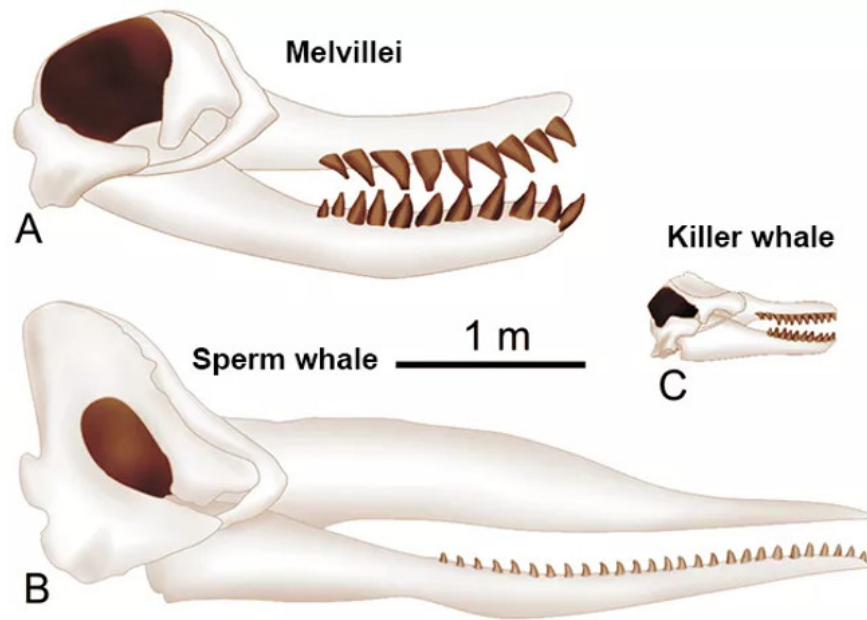

Melvillei's jaw

Melvillei possesses a **3-meter-long skull bone** with a wide jaw and **conical teeth up to 36cm long** - the largest of all animals.

At the same time, the upper jaw teeth are also concave, which helps close the lower teeth when closing the mouth, increasing the ability to cut meat.

The temporal cavity, where Melvillei's jaw muscle is attached, is also larger, allowing them to have stronger bite force.

Size of Melvillei's solar sockets, sperm whales (Sperm whale), and killer whales (Killer whale)

A sperm whale who defeated the 13-meter-long **giant squid** , Melvillei, with perfect structures for hunting giant prey that created, gives you the ability to kill so much.

In addition, when studying the Melvillei fossil, scientists found that the first part also carried the **body containing wax oil** similar to sperm whale. In sperm whale, this organ helps support deep diving, sound locator broadcasting, and self-defense tools used to gorge. The function is probably similar in Melvillei, even they think they use it as a hunting weapon.

With small prey, Melvillei only needs to attack with a lightning strike, but with large prey they will take a bit more time and effort. This species will use its head as a giant hammer, plunge directly into the prey's body at high speed, causing damage to the internal organs, causing the victim to weaken before cutting flesh.

More frightening, this species still **lives in groups** and they know how to coordinate groups to hunt, making them easy to take down any giant prey.

If Megalodon confronts Melvillei, in this mortal battle, who will be the victor.

In terms of size, Megalodon's physique seems to possess a lot of advantages: maximum weight is twice Melvillei, strong biting force, solid body, and no need to surface the water to breathe air.

But considering the weight, Megalodon's 100-ton figure is the largest according to some scientists' estimates, and it is now widely accepted that giant sharks weigh only about 50 tons of 18 meters long, equal to the Melvillei whale.

And though physical strength is not equal, Melvillei compensates **for the high-level intelligence of mammals** , with hot blood giving them the ability to manage more quickly.

According to a close discovery, sharks can fall into a coma if they are turned on their stomach. Orca killer whales know that flaw and apply it to hunt white sharks today. Suppose in the past Melvillei was smart enough to use this way with Megalodon only water . surrender soon.

In the end, the most important and decisive factor for the victory of Melvillei is that they go hunting in the herd and Megalodon hunts alone.

One-on-one, the results are difficult to identify but 2, 3, or more Melvillei together "cooperate in battle", it must be a Megalodon that is so fierce that they must fall.

Therefore, in order to sum up all the factors, the probability of winning the match with Melvillei is higher than Megalodon. What do you think about the outcome of the battle between these two ancient monsters.
