

# What does the back of Nothing Phone 1 do?

The glyph interface is also designed to minimize screen time. According to Nothing, you can pair individual contact numbers with a specific ringtone and have a distinctive light pattern on the back.

For years, phone manufacturers have chosen the display as the focal point of their devices. Not simply the notch, water drop or camera hole, changes such as increased resolution, refresh rate or screen brightness. But with Nothing Phone 1, the emphasis is not only on the screen.

It sounds counter-intuitive, but the Nothing Phone 1 has a defining feature on the back. That defining feature is **the glyph look**, which consists of a strobe light strip displayed on the transparent back of the device. There are more than 900 LEDs that power the light strips, such as message or voice call notifications or app calls.

In addition to lighting and light shows according to the announcement. The glyph interface is also designed to minimize screen time. According to Nothing, you can pair individual contact numbers with a specific ringtone and have a distinctive light pattern on the back.

That way, even when you put your phone face down, you still know who's calling you. That helps you reduce screen time even if it's not significant. Nothing Phone 1 has a "Flip to Handle" mode, which only activates when the phone is flipped up, provided it must have been flipped face down before. This mode mutes the device, but still lights up to indicate a call or notification.

## Is the Glyph interface really useful?

For people who text a lot, the glyph interface is not really useful. Most people use their phones often with the screen facing up, and in the case of face down, it is during a meeting, interview or similar.

So while this feature is fun, there's no guarantee it will create a particular usage pattern for many people. Almost every time the light came on, people would immediately flip their phones over.

If you want to create this habit, the glyph interface must allow the user to change the lighting based on the application. Each notification from the app will be a different light, we can expect more in the updates for Nothing Phone 1. Aside from the funny back of the Nothing Phone 1, this is also a phone with a good configuration to use.
