

What if the emergency exit door is open while flying?

Passengers who arbitrarily open emergency exit doors on airplanes while flying without incident will be severely punished but such unfortunate incidents still occur. It seems like they are not aware of the seriousness of this action.

Passengers who arbitrarily **open emergency exit doors on airplanes** while flying without incident will be severely punished but such unfortunate incidents still occur. It seems like they are not aware of the seriousness of this action. So, what happens if the emergency door is opened when the plane is flying?

Normally, when the plane is in the air, we will not be able to open the emergency exit. Because of the huge internal and external **pressure differentials** . But when the plane has not reached the required pressure, it is easy to open the exit door.

Do not open the emergency door on the aircraft

Hypothesis is given when the emergency door is opened in only 15 seconds. At this time, at a height of thousands of meters, a very low temperature of -26 degrees C will cause all passengers in the plane to freeze. The outside air will spill into the plane, causing oxygen levels to drop, then **the oxygen mask** will automatically be dropped. If you don't wear an oxygen mask, you will have difficulty breathing, cyanosis, fainting and death.

You need to quickly wear an oxygen mask

In particular, if you don't wear a seatbelt at this time, you may be sucked into the air. This can be seen in sci-fi movies.

So if the plane has landed, will the passengers arbitrarily open the escape route cause any trouble? The answer is yes. Meanwhile, it will no longer be dangerous for the passengers' lives on the plane, but **the life buoy bridge** will automatically open. This makes the airline forced to mobilize alternative aircraft to ensure safety for the following flights. Therefore your **flight will be delayed** .

The pontoon bridge will open if the emergency door is opened when the plane has landed

Therefore, we also need to equip ourselves with the necessary knowledge when traveling by plane to ensure safety for ourselves and other passengers and avoid being penalized for lack of understanding.
