**Many users today are still confused between Micro USB charging cables, USB cables and lightning cables. In addition to clearly distinguishing the types of cables as well as learning about 2-head USB cables will help you buy the right product and use it for the right purpose. In the following article, let's learn about what a Micro USB cable is and the types of 2-head USB cables that are popular today.**

## What is a Micro USB charging cable?

There are many types of charging cables from technology brands equipped for mobile devices today. Of which, the most popular are 4 types of ports: Lightning port on Apple products; USB-A port on laptops, computers and chargers, USB-C port on Android mobile devices and micro USB port. Each type of port will only be compatible with the corresponding type of cable.

Micro USB charging cables are developed on the charging devices on the phone. With the standardization of the Micro USB port, smartphone manufacturers have allowed users to use different charging cables to charge their devices.

Many mobile devices such as Android smartphones or GPS trackers come with a Micro USB charging cable. Although Micro USB is smaller than the Mini USB-Type B above, this new connection port is capable of transferring data at the same speed as a regular USB.

Micro USB charging cables are fairly easy to identify. The design of a Micro USB charging cable is usually black and has a compact 5-pin connector. Most Micro USB charging cables have a USB connection to allow for transfers between desktop computers and mobile devices. It is important to note that they are not compatible with all devices. Additionally, there are also Micro USB 2.0 or 3.0 versions; not all Micro USB 3.0 models are compatible with older ports and connectors.

Micro USB is currently the most popular connection port on phones today, used a lot on phones, wireless headphones, speakers. Micro USB cable has the function of charging batteries and transferring data between devices.

## **Advantages and disadvantages of Micro USB cable**

As mentioned, the Micro USB charging cable is essentially a miniature version of USB-A and was developed for use on mobile phones and accessories. The main advantage of this type of USB cable is its compact size but provides a transmission speed equal to that of USB ports. In addition, because of its widespread use, a Micro USB charging cable model can be used to charge many different devices from different manufacturers.

Disadvantages: Difficult to plug in, can only be plugged in one direction, more inconvenient than a 2-plug USB cable so it is easy to plug in the wrong direction, wasting time and easily damaging the connection cable.

Compared to the Lightning connection port on later generations of iPhone or iPad, the Micro USB connection port is considered to be less durable and less convenient (the Lightning port allows users to connect the cable without having to connect it in the right direction or on the right side because the two sides of this connection cable are the same).

## **Some popular types of Micro USB cables today**

In addition to learning about **Micro USB charging cables**, you can refer to some popular types of 2-headed USB cables today. Each of these types of connections requires different accessories and connection ports to operate. A cable that only works with Micro USB ports will not work with USB, and vice versa. Knowing the differences between each of these connection formats will help you determine which products are needed for which devices to operate most effectively.

- **2-head USB cable:** This type of cable is used for charging or data transfer, but very few people use it, and not many accessory companies still produce this type of cable.
- **Lightning to Micro USB cable:** This type of cable is also quite rare on the market due to low demand.
