Dashboard for us is probably not something new. An integral part of making quality business assessments that cover the whole problem. But to understand its meaning and show it is what we need

**Dashboard** for us is probably not something new. An integral part of making quality business assessments that cover the whole problem. But to understand its meaning and present it is what we need to care. So what is Dashboard? What is Dashboard? Definition of Dashboard?

## 1. What is Dashboard?

**Dashboard** can be understood as a digital control panel, or a digital interface used to collect and synthesize data of the entire organization. Not only does the dashboard provide in-depth data about your business, it also gives an overview of each department's productivity, trends, activities, **KPIs**. ( **Key Performance Indicator** - also known as performance evaluation index)

*An example of a Dashboard showing the business performance in a year*

**Dashboard** gives an overview of all aspects of an organization's business so that the presentation must be easily understood and comprehensive only on the reporting page. The explanation, though brief, should cover all the essentials, including metrics for each category and a few important keywords. With customizable flexible reports, managers can see their business performance metrics with multi-dimensional graphs, consolidating reports into the frequently used features as well. will save a lot more time.

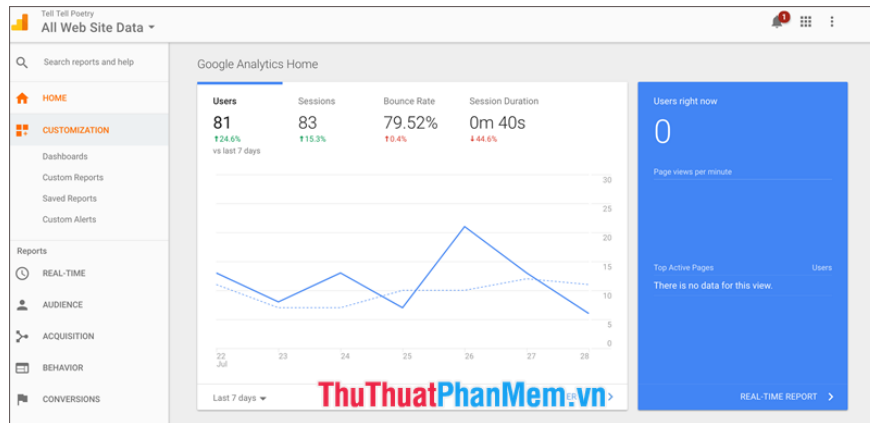

## 2. What is Dashboard? How is it different from traditional reporting?

**Dashboard** is usually created by professional economic analysts. It must cover all content that the developer wants to present. Issues are aggregated from small reports (**Report**) collected during the process of production and business activities. It can be seen in one **dashboard** has a lot **Report (Report)** in it. To avoid confusion between the two definitions **Report** and **Dashboard** , we need to know **the Dashboard** is the **table of information synthesis** to combine multiple **report ( Report )** on a display screen, allowing viewers an overview and quickly more Various administrative information. Still **Report ( the Report )** is simply the management reports present data in multiple content and different angles depending on the needs of managers.

## 3. Definition in Dashboard and the advantages that Dashboard brings.

Dashboard is an integral part of the **Business Intelligence Management System ( BI )**. With **Dashboard** , administrators have a better overview of the situation of their business. At the same time they can make short-term or long-term predictions based on the **Dashboard** . Because it requires a general overview, **Dashboard makers** must be very careful when selecting data so that it is brief, but covers all the issues raised in that report. Compared to normal report, **Dashboard** somewhat superior by the meaning and information it expresses in it. It usually includes small reports such as business activity: finance, business, personnel, etc., until the statistics are recorded over the years as information for predicting plans in future of business.

In addition to business, in the digital age, **Digital Dashboard** is also important for those who work in the field of **MMO ( Make Money Online )**. With analytics and reporting system of **Google ( Google Analytics )** , it helps website administrators to statistically count the number of users and the growth rate of websites through each stage.
