What is ip camera? Advantages of ip camera

What is IP? IP stands for 'internet protocol', roughly translated as internet protocol. IP camera is one of the surveillance cameras with images digitized, processed and encoded from inside and transmitted signals via Ethernet connection to a computer or a digital signal storage device such as NAS, server or IP recorder.

Each IP camera will have a private network IP address and a built-in web interface to be able to access and manage based on this IP address via WAN, LAN or internet. As a result, they can transmit observable images to computers, phones, and tablets without the need for intermediaries like traditional cameras.

Current types of ip cameras often use two types of sensors: CMOS and CCD. Their models are also quite diverse with different shapes like Pan / Tilt / Zoom, dome, warhead, camouflage, box, infrared, wireless, .

IP Camera

It can be said that **cam ip** is one of the most modern surveillance cameras today. They possess many outstanding advantages that traditional cameras do not have:

1. It is possible to operate independently without the help of the recorder
2. Equipped with memory card slot for storing images
3. High resolution, delivers clear images
4. Supports 2-way audio, allowing users to talk back and forth
5. It is possible to go to the network if wifi does not meet operational needs
6. Can be combined with the recorder to increase image storage
7. Easy to install, easy to use and convenient

Which camera of a good company should buy the most today?
