When you look at the instructions for using the different software on Windows 10, you will most likely encounter the term Run as Administrator. So do you know what Run as Administrator is? What do they mean on your computer system and how does that affect them?

When you look at the instructions for using different software on Windows 10, you will often encounter the phrase "Run as Administrator". So do you know what Run as Administrator is? What do they mean on your computer system and how does that affect them? In this article, the Software Tips will help you learn about Run as Administrator and how to run the application with the **Run as Administrator** permission .

1. What is Run as Administrator?

In essence, on our Windows operating system is divided into many accounts for all users and only the Administrator account is the highest account - holding all the changes on Windows. It is the same as: Administrator is the master key of a house and User accounts are the room keys in that house. Without Administrator rights, the User accounts can only use the resources contained in that room, while the Administrator account has the right to intervene more deeply in all content in that house. The content that Administrator rights can interfere with is: security, data, software installation, access to files on the computer, access to different graphic and sound engines, etc.

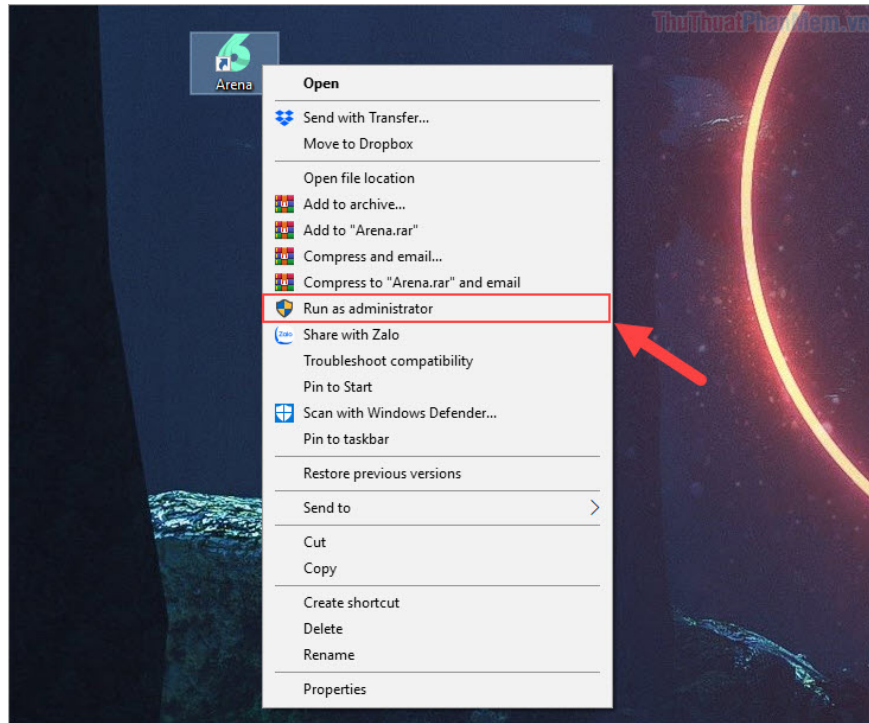

When you run applications on User accounts, those applications only have access to the resources that the User account is licensed from the Administrator. Because of that, when applications generate files or need files in the system to operate, they will not be found and unusable, causing errors. When running as Administrator, free applications are free to use resources on Windows 10 so they can maximize the performance of the application and be free from errors. There is some software that is pre-set on startup that will require Administrator privileges to limit errors during use and most new applications today are set as such.

2. Instructions on how to run the application with Administrator rights

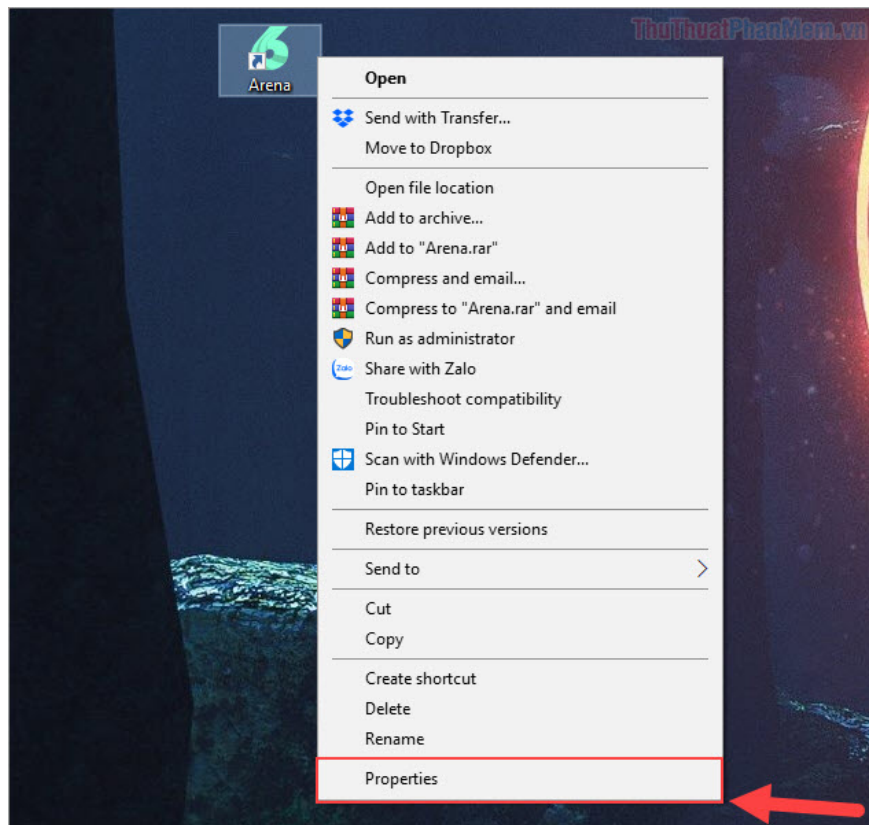

Method 1: Run Administrator rights manually for each access

You **right click** on the application that you want to run as Administrator and select lines **Run as Administrator**. After that, a message board appears, select **Yes** to complete.
