

# What is the world in the eyes of young children under one year old?

When newborns, their vision is 12 to 25 times worse than an adult and the color is not distinguished.

Children under one year of age see the world as very different from adults but how it is different from all parents. When newborns, their vision is 12 to 25 times worse than an adult and the color is not distinguished. Children's vision has many changes during this period, and it is not until they are 11-12 months old that they can determine the distance is relatively close. Only when children are 2 years old, their eyesight is maximized.

1. 10 common diseases in children in the fall, symptoms and prevention
2. It is the parents' habits that affect the development of young children
