

# What to do when the iPhone has a headset mode error?

What causes your iPhone to be stuck in headset mode? How to fix it?

Most for iPhone users must have once fallen into the case of a smartphone stuck in headset mode. When this error occurs, it will cause many problems such as not being able to adjust the volume, not hear the ringtone when a call, not hear the music and the Headphone message will appear on the home screen. Surely this makes many people uncomfortable when falling into this dreadful situation. So what causes this problem and how to fix it? Let us find out this error in the article below.

## 1. Causes your device to be stuck in the headset

Most iPhones when stuck in headset mode are often unable to find the exact cause of this error. Sometimes an error occurs due to the following actions:

1. Disconnect the headset or speaker too quickly.
2. Disconnect the headset or speaker while your device is processing another task.  
Use headphones or speakers of poor quality or incompatible with the device.
3. Your 3.5mm headphone jack is damaged.
4. Plug in the earpiece closed dust, rust due to long time not clean because I used to be careful not to stick dust or steam into
5. Error caused by software on the device

## 6. Hardware error

### 2. Method to get the device out of headset mode

Currently Apple has not found a way to thoroughly fix the headset mode error. So, when the device falls into this situation, you can apply some of the following methods to resolve temporarily.

#### **Plug in the headset (or speaker) again to bring the device out of headset mode**

A simple way that you can apply and try right away if you miss your iPhone has this error: plug the headset or speaker into the phone and pull out quickly. You do this again and again to help the iPhone reset the mechanism that allows iOS to recognize when a headset or speaker is connected. This is the simplest and easiest way to fix the problem of temporary stuck in headset mode.

#### **Try with another headset (or speaker)**

In addition, you can also borrow a headset or other speaker jack to try it on your device for differences. Perhaps your headset is poor quality, not up to Apple's standards, causing your device to fail.

### **Restart your device**

If you have applied the above two ways but the device still fails, try restarting the device to see if the situation is better? When rebooting the device, your device will be refreshed to the original settings.

### **Check inside the headphone jack**

If all of the above methods still can't get your device out of a stuck error in headset mode, this may be due to a hardware failure with your jack.

Please use a flashlight, place it horizontally with the 3.5mm headphone jack and check if there are any traces of water or metal fiber that can cause an electrical breakdown. You can also use a toothpick to clean the 3.5mm headphone jack.

### **Restore iOS version**

After trying everything and still not solving the problem, you can restore the iOS version because sometimes the cause of the error may be an error on your iOS version itself. However, this error is rarely encountered, but if you try to install some tweaks (Tweak), it is possible that these tweaks cause a stuck error in your headset mode.

Try to bring the device to DFU mode, or update from DFU mode if necessary, and any corrupted iOS files will be replaced with new, efficient files.

### Contact your service center

If the problem is not from your software, chances are your 3.5mm headphone jack is an error jack. This happens when you use a low-quality headset that does not meet the Apple manufacturer's standards. When this is the case, your only hope is to contact the service center for the earliest repair.

I wish you all success!
