

Who would have expected these strange creatures to live with humans on Earth in the future

Scientists have researched and made a list of species that might be 'heavenly' with us for the next few thousand years. Surely you will not be surprised to see their strange shapes.

Scientists have researched and made a list of species that might be 'heavenly' with us for the next few thousand years. Surely you will not be surprised to see their strange shapes.

1. The most bizarre creatures are found by scientists under the sea floor of Australia
2. Goose bumps with movements like fictional creatures of bloodworms
3. Mysterious creatures 'dance' strange dance when someone touches it

1. Bats "long legs"

The bats that are expected to "descend" in the future Earth have the scientific name *Manambulus perhorridus*. This bat has a rather bizarre shape with long, large legs, the wings seem to be less active as before and have a more virtual positioning mechanism, the ears and nose may be paralyzed.

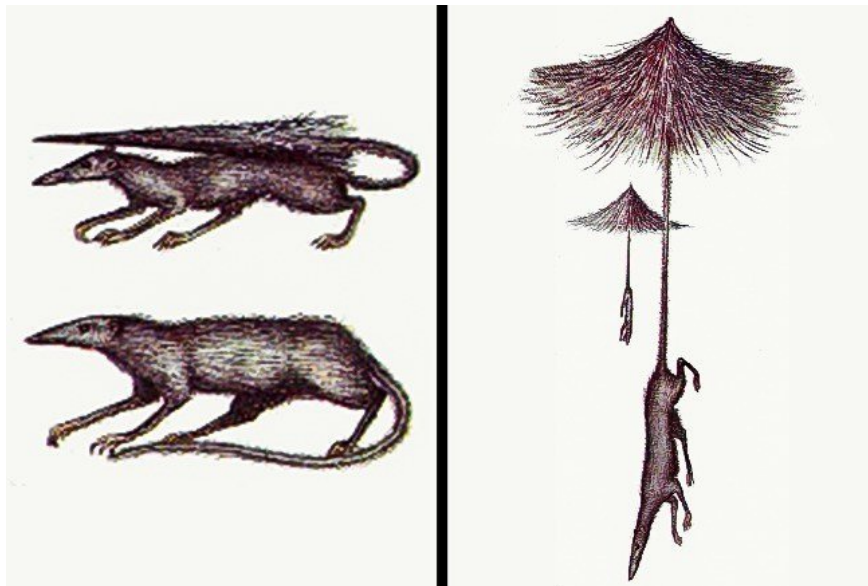

2. Necropteryx

This strange shaped creature is called Necropteryx, a combination of birds, kite birds and vultures. They own a fairly large mine due to the task of biting a bone in the process of eating the dead bone.

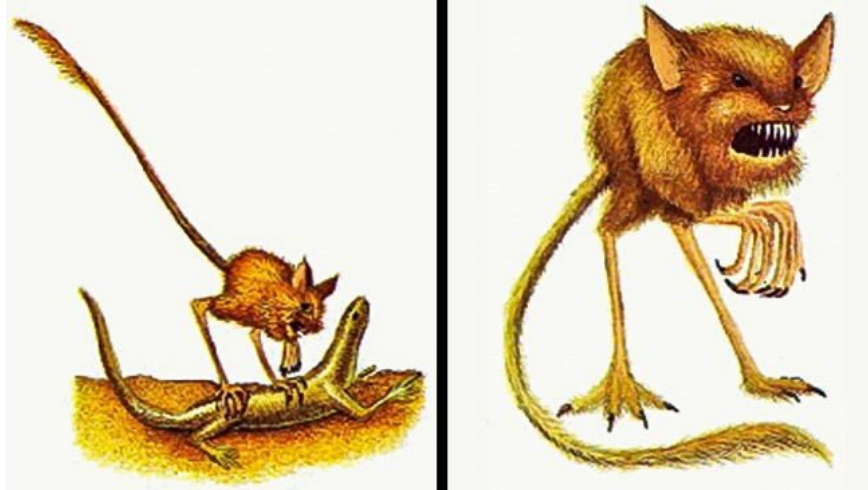

Necropteryx has no wings so they walk. To find food, they can reach as far as 10km per day. In particular, Necropteryx laid eggs on animal carcasses and then considered it their nest.

3. Mouse "tail cell"

Over the course of evolution, after a few thousand years the rat species will appear on Earth, particularly in North America. They are the first animals to use their tails to balance. The food of this rat is an insect and they use the leg to stomp and catch prey in the air.

4. The devil danced to *Daemonops rotundus*

The creature has a monstrous appearance with the face and body of the mouse, long ears like bats, long and strong legs like this kangaroo known as the **dance jumper *Daemonops rotundus*** . With such physical characteristics, they are visually a predator in the desert. They use long legs to hopscotch like kangaroos, crossing long distances in the desert.

5. Terabyte Circle

This new toe insect that appears in the future can defeat prey by a powerful chemical weapon system. Their food is algae.

6. Wakka

Anabracchium struthioforme, or wakka, is a giant creature that has a rather heterogeneous structure, no forelimbs, long limbs, long necks that are roughly equal to the legs that help balance gravity. Their food is grass and they live mainly in South American grasslands.
