An electric blanket is a great way to get warmer in winter, protecting you and your loved ones' health.

Principle of operation of electric blankets

Electric blanket (also called electric cushion) is made up of 2 parts: the body and the control device.

The electric blanket body is made up of two or more layers, including a layer of thermal conductors that are inserted inside the fabric layers:

1. **Thermal conductor** : made up of 2 components, the heat conductor core and synthetic fiber covering the outside. The core only has the effect of conducting heat, not conducting electricity, surrounded by heat-resistant synthetic fibers.
2. **The fabric of the cushion body**: made of two or more layers of fabric and cotton that are fastened together through heat pressing. The fabric used is usually cotton and velvet felt.
3. **Control device**: constructed with different heat retention steps (with many heat retention steps). Built-in self-disconnection and power-saving mode ensures user safety.

With the above structure, electric blanket products are considered to be absolutely safe for users. The probability of electric leakage is unlikely to occur, the impact of the magnetic field is negligible. Product life depends heavily on the quality of the fabric on the body and the durability of the control box.

Using a heating pad just gives us a pleasant and warm feeling that users can breathe fresh air at night. Using electric blankets helps to provide stable warmth for the body in cold weather.
