

# Will feature new screen capture for Windows 10

Screen Clip was detected on Windows 10 Redstone 5.

Although Windows has already implemented several ways to create screen capture tools, a new feature has just been discovered on Windows 10 Redstone 5 called Screen Clip. This feature allows users to drag the selection on the screen and then create a photo from there.

Originally discovered by *WalkingCat*, it was confirmed by Fafael Rivera of *Thurrott* on Redstone 5 Build 17639. Redstone 5 is the next Windows 10 update, after Spring Creators Update is about to appear.

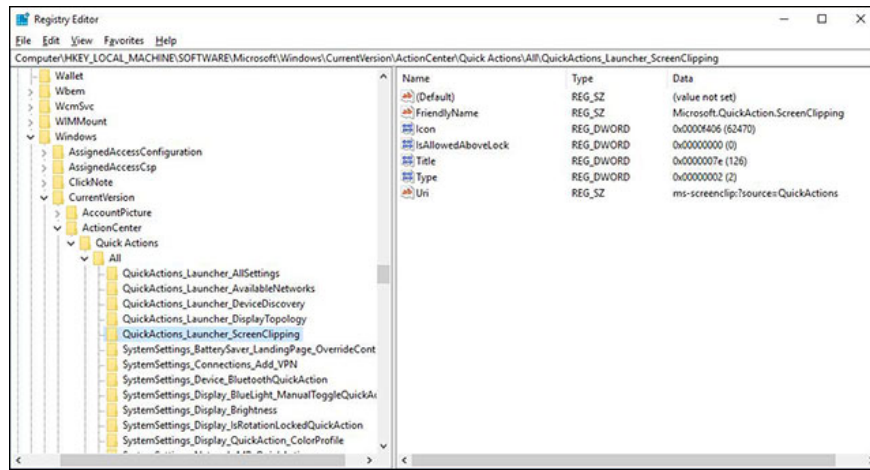

This feature has a Quick Action mode, when it is turned on, it displays a full-screen layer with 3 options, including a square selection, free selection and full screen selection. With these 3 tools, select the image area you want to grab. Below is an example of a rectangular selection created by Rivera.

*Create a selection by dragging the familiar mouse button*

The registration key of this new Quick Action can be found at.

HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\ActionCenter\QuickActions\AllQuickActions\_Launcher\_ScreenClipping

## Registry of Screen Clip

This is a simple but very useful feature, especially when there are more types of options, such as selecting a certain window or creating a GIF or video image from the selection.
