

# Will the hair grow thicker and darker after each shave?

In life there are countless facts that seem to be obvious, but they are not true. And the thicker and darker hairs after shaving are also one of the myths that we still believe.

In life there are countless facts that seem to be obvious, but they are not true. And the thicker and darker hairs after shaving are also one of the myths that we still believe.

1. Close-up of the transformation of the human body after death
2. 5 parts of the human body become redundant and useless due to evolution
3. If stretched all the way, how big are the human organs?

When it comes to puberty, the human hair follicles will begin to flourish. The beauty will start waxing and the boys will start shaving. But then you will get advice: *'Don't be foolish to shave your hair, shaving them will grow thicker and darker than that'*.

But the reality is not so.

According to Amy McMichael, a dermatologist, women often wax their legs, and if every time they shave their legs, they will soon turn into gorillas.

To answer many people's questions and worries, the researchers conducted many studies and found that it was true that after many shaving and waxing, they had grown thicker and darker.

But the real cause behind this phenomenon is the hormonal fluctuation during puberty. When the hormones increase, the thickness of the coat and many other factors are affected.

In addition, another cause also makes you feel harder, darker hair is the feeling. The hairs protruding from the body tapered at each end. When you shave them, the hair that is cut in the middle forms a sharp and rough surface every time you touch it. This will "trick" your eyesight to make you feel more hairy after each shave.

In short, shaving or hair removal does not affect their process. And of course, hair or beard will not grow thicker and darker after each shave.
