

# Windows 10 October 2018 is new, Microsoft is forced to stop updating for some computers

Recently, Microsoft had to stop updating its 2018 version of Windows 10 October for the second time, for some computers using Intel's Drivers.

A month ago, Microsoft officially released the Windows 10 October 2018 update (Build 1809) but then had to stop publishing to fix it because of a serious error that caused the user's data to be automatically deleted.

Recently, Microsoft has re-released Windows 10 October 2018 version, after fixing the error of deleting user data. But it seems that the vicious cycle of Windows 10 October 2018 version is still not finished when recently, Microsoft had to stop updating this version for the second time, for some computers using Intel Drivers Graphics.

The reason for this is because Microsoft discovered an error related to Graphics Drivers of Intel (released before Windows 10 October 2018) not compatible with Windows 10 October 2018 update. Specifically, chip manufacturer accidentally activated some features that Windows does not support when updating new version of Graphics Drivers, making the monitor's speaker or TV connected to the computer via HDMI, USB-C or DisplayPort not receive audio signal.

Currently, Microsoft is partnering with Intel to fix this problem. Earlier, to fix problems related to iCloud applications on the computer of Windows update 10 October 2018 Microsoft also had to cooperate with Apple. .
