

Windows 10 update again, this time not only slowing down the user's computer

This is an update that brings the new Edge browser to Windows 10.

In January 2020, Microsoft officially launched a new Edge browser built on the Chromium kernel. At that time, if you want to use Windows 7, Windows 8.1, Windows 10 and macOS users, you will have to download the new Edge yourself.

Last month, Microsoft announced that it would release a Windows 10 update to bring Edge to users automatically. This will help the new Microsoft Edge reach more users because users who want to use it also do not have to download the manual installation.

A new update of Windows 10 slows down a user's computer

However, according to some users, the new Edge update with the model number KB4559309 makes their computer slow, lag when using normally and reduce graphics quality when playing games. Even, some people are unable to boot normally, can only enter Safe Mode.

More annoyingly, this update is automatically downloaded and installed on your computer and you cannot delete it. Normally, if the cumulative update of Windows 10 encounters an error, you just need to uninstall it but when uninstalling KB4559309 you will receive a notification that this is a mandatory update, cannot be uninstalled.

How to fix the problem

If you have installed the KB4559309 update, you need to use the System Restore feature to roll back to a previous version of Windows 10.

Windows Update

Restart required

Your device will restart outside of active hours.

2020-05 Microsoft Edge Update for Windows 10 Version 2004 for x64-based Systems (KB4559309)

Status: Pending restart

Restart now

Schedule the restart

This update, KB4559309, will bring the new Edge browser to Windows 10

If not, there are three ways to prevent Windows 10 from installing KB4559309 by itself. The first way is quite simple: you download it yourself and the new Microsoft Edge preset. The second way is to use the specialized Blocker Toolkit, which Microsoft launched earlier this year. And the last way is to modify the Registry.

Of these, the third way is the most complex, you can follow these steps:

1. Open **Registry Editor** on Windows 10
2. Search section: **HKEY_LOCAL_MACHINESOFTWAREMicrosoft**
3. Right-click on the **Microsoft** key
4. Select **New**
5. Click on the **Key**
6. Name it "**EdgeUpdate**" and press **Enter** to save the changes
7. Right-click on the newly created "**EdgeUpdate**" key and select **New**
8. Click **DWORD (32-bit) Value**
9. Name it "**DoNotUpdateToEdgeWithChromium**" then press **Enter**
10. Click twice on **DWORD** and change the value from **0** to **1**
11. Click "**OK**"
12. Reboot

After repairing the Registry, your computer will not download and install the new Edge update of Windows 10. I wish you success.
