

Windows 8 has many advantages over Android?

ARM, which develops microprocessor technology for famous mobile devices, believes that Microsoft's Windows 8 (OS will support both ARM architecture processors) will have a very good chance to compete with Android on. Mobile device market.

ARM, which develops microprocessor technology for famous mobile devices, believes that Microsoft's Windows 8 (OS will support both ARM architecture processors) will have a very good chance to compete with Android on. Mobile device market.

According to the company, the popularity of Windows is a decisive factor to help Microsoft gain an edge over the two rivals that dominate the mobile market today. " *Users are very familiar with Windows and Android is still an unfamiliar environment. This is a huge advantage that Android doesn't have. Microsoft is smart enough to exploit that advantage and that's the difference.* "East Warren, CEO of ARM said.

Tablet and notebook models use ARM chips and run Windows 8 at Computex 2011.

Although recently, Windows market share has been more or less reduced, but this OS still accounts for about 90% of ARM's PC and speech market share is quite well-founded. However, Windows 8 running on ARM-based devices will not be compatible with applications designed for x86 processors, but will only run programs developed for the Metro interface, an interface that is quite controversial.

ARM is putting a lot of hope on Windows for ARM processors, and at Computex last June, Microsoft also showed a number of notebook models running ARM processors from Qualcomm, Texas Instruments and NVIDIA. The latest Microsoft operating system promises to be officially released in October this year.
