

Xiaomi will launch the world's first Android 10GB RAM

Apple only upgraded their phone memory to 4GB.

Xiaomi's new Mi Mix 3 phone will probably mark a new milestone in the smartphone industry by possessing super-high memory.

According to Xiaomi Spain, this phone can support 5G network, with RAM not less than 10GB and is the first phone in the world to reach this figure.

Currently, 8GB phones are also quite popular, but no manufacturer has jumped to 10GB. After Xiaomi's Mi Mix 3 launches, there will probably be many phone companies following the Chinese manufacturer's heels.

If you are wondering why this phone needs so much memory, the cause is still unclear at this point, but there are rumors that it will have a 'pull out' camera on the front. The phone should probably help the memory to increase image processing capability. However, it is necessary to wait and see how Xiaomi's camera configuration will be.

10GB of RAM on the phone is a very impressive number and also shows how the Android ecosystem is growing. We also see the difference between Android and iOS when the iPhone only has 3GB of RAM, iPhone 7 even has only 2GB of RAM and the latest iPhone generation is only raised to 4GB.

Mi Mix 3 will be the phone with the largest RAM

However, Apple focuses on software optimization, so the 4GB configuration is enough to handle most tasks even though some processes will need more memory, especially when multi-tasking is active.

Xiaomi's new phone model will probably be launched next year. This is also their next high-end segment phone, thanks to the support of 5G network, the data transfer rate will also be faster when the technology is widely supported.
